

Achieve easy e-commerce and PCI compliance using the leading cloud-based service integrated with Microsoft Dynamics NAV.

ChargeLogic Connect is a cloud-based service that enables businesses to easily achieve PCI compliance. As a PCI validated payment gateway, Connect provides an easy way to integrate **ChargeLogic Payments** and Microsoft Dynamics NAV with e-commerce sites to get up and running fast. Connect also provides services for businesses that don't have e-commerce sites—services like Secure Remote Storage and Click-to-Pay Invoicing—providing businesses with convenience and security.

ChargeLogic Connect Options:

- Hosted Orders
- Hosted Payments—ChargeLogic Checkout
- Secure Remote Storage
- Gift Cards
- Click-to-Pay Invoicing

Key Benefits:

- PCI Compliance
- Fewer transaction fees
- Secure customer credit card data
- Standard web services interface
- Bring web orders into NAV without costly customizations

Connect is for Every Business

From multi-channel retailers to nonprofits, if you accept credit card payments, **Connect** provides valuable, secure services that are easy to implement. Businesses with e-commerce sites can choose from any of the services offered with **Connect**. Secure Remote Storage and Click-to-Pay Invoicing are great choices for all businesses that accept credit card payments.

Easy E-commerce

ChargeLogic Connect makes connecting e-commerce sites to NAV a snap. Connect uses SOAP web services, making it easy for your web development team to design and create the e-commerce site that you want and bridge it to NAV. **Connect** acts as a payment gateway for e-commerce sites, but with capabilities that standard gateways don't have. It integrates with **ChargeLogic Payments** and NAV, allowing your web orders to transfer to NAV automatically as a part of the service—no custom development is required. Because live transactions are brought into NAV via ChargeLogic Payments, **Connect** allows you to charge the credit card at the time of shipment and refresh the authorization in the event of a back order.

Connect's innovative design actually lowers the number of transaction fees compared to a traditional payment gateway, helping to reduce costs for businesses.

PCI Compliance

Securing credit card data is serious business. At ChargeLogic, we take protecting your customer data seriously. **ChargeLogic Connect** has been PCI-validated through an independent audit, providing assurance that your data is safe with us. **Connect** is beneficial for any business that processes credit card payments, regardless of whether or not you have an e-commerce site. **Connect** offers a selection of services that helps your business adhere to the necessary PCI guidelines. From Connect's Secure Remote Storage to ChargeLogic Checkout, **Connect's** unique method for securing credit card data **makes it unnecessary for your business to store credit card information locally**, keeping your business out-of-scope for PCI compliance.

ChargeLogic Connect for E-commerce Businesses

HOW IT WORKS

ChargeLogic Connect is a subscription service with a nominal one-time setup fee and a recurring, monthly subscription fee. Click-to-Pay Invoicing, Hosted Orders, Gift Cards, and our Hosted Payment solution, ChargeLogic Checkout, charge per-transaction fees. Secure Remote Storage is available to all businesses for a flat monthly fee.

HOSTED ORDERS

ChargeLogic Connect's Hosted Orders provides a secure, efficient service for securing orders on your e-commerce site and transferring them into Microsoft Dynamics NAV. Hosted Orders enables your e-commerce site to send both payment information and order details through **Connect** and automatically populate NAV. The orders and payment details are held securely on the **Connect** servers until NAV polls for web orders on a periodic basis. At that time, all pending web orders are created in NAV as Sales Orders with all appropriate payment information attached to them.

HOSTED PAYMENTS-CHARGELOGIC CHECKOUT

ChargeLogic Checkout is a hosted payment environment that alleviates business' e-commerce sites from the burdens of PCI-compliance. **Checkout** removes e-commerce sites from the payment process through two integration options: a Hosted Payment Page or a Hosted Payment Window. **Checkout** can be integrated into nearly any e-commerce solution.

Using the **Hosted Payment Page** requires the e-commerce site redirect the customer to **Connect's** server for the payment stage in the web order checkout process. The **Hosted Payment Window** option allows the customer to remain on the merchant's site throughout the entire process by seamlessly providing fields for sensitive data in an inline-frame.

GIFT CARDS

Deploying gift cards in a multi-store or multi-channel environment puts retailers at risk for theft and fraud. With the speed and access of smartphones and wireless communications, customers can use the same gift card in a store and online within seconds, beating even the best data replication schemes.

ChargeLogic Connect Gift Cards allow merchants to issue, redeem, and perform balance inquiries using their own custom gift cards, while avoiding replication headaches. Because **Connect** Gift Cards use the **Connect** servers to maintain transaction details, balances are always up-to-date on the web, at the till, and in the back office.

ChargeLogic Connect for All Businesses

REMOTE SECURE STORAGE

Get the PCI-compliance benefits of tokenization without the per-transaction fees, downgrades, or lock-ins associated with third party providers. **ChargeLogic Connect's Secure Remote Storage** offers a twist on traditional tokenization by delivering "side-channel tokenization".

With **Secure Remote Storage**, ChargeLogic Payments makes a real-time request from the **ChargeLogic Connect** server for a token for the credit card number and stores the token. When the transaction is submitted, **Payments** makes another real-time request from the **Connect** server for the card number so that it can be submitted directly to the payment processor.

The card number is never stored in the NAV database. Instead, when the card number is required for payment processor communication, ChargeLogic Payments retrieves it from **Connect**, securely transmits it, and then forgets it. This allows users to maintain the direct connection to their payment processors while removing NAV from PCI scope.

CLICK-TO-PAY INVOICING

Click-to-Pay Invoicing enables you to email invoices that contain a link to a secure website for online payment by credit card or electronic check. By combining electronic invoicing and cloud-based electronic payments, **Click-to-Pay Invoicing** provides a fully automated, turnkey solution that helps you get paid faster and with less paperwork.

All for less than the cost of a stamp.
